

Length to Weight relationship for Bullhuss and Ray species.

- The following length to weight graphs have been derived by Cefas and collected from commercial fishing catches in the Western English Channel.

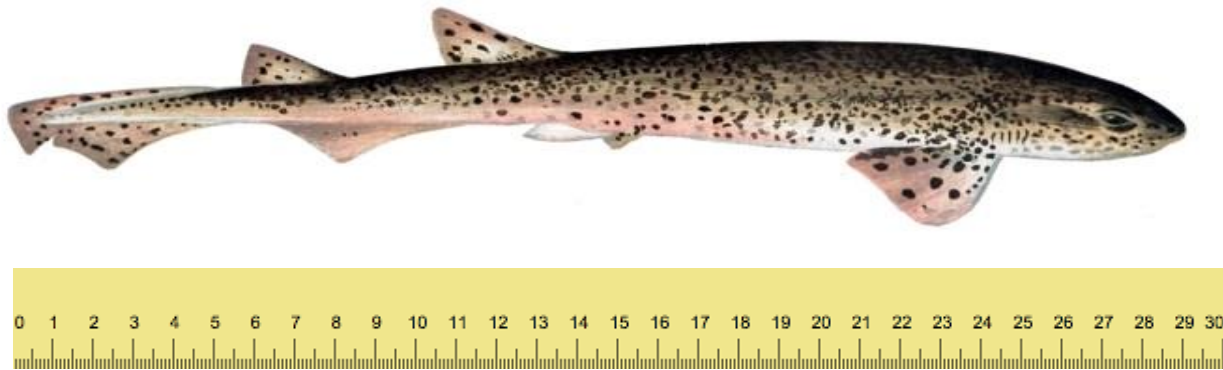

Recording fish through catch and release.

The following species will be available for catch and release:-

Bass, Smooth hound, bull huss, tope, sharks and ray species

- To be able to record a fish, the angler will need to provide a clear photograph of the full length of the fish against a tape measure.

- The photograph is to be presented to the Club recorder who will verify the species identification and record the length on the club monthly return as if weighing a fish in the normal way.
- Fish over 100% of the specimen weight to be phoned through to the CFSA Recorder in the normal way with a photo of the fish emailed through to confirm the length and species.
- All potential record fish and fish caught in open or CFSA one day competitions are to be weighed on certified scales.
